

Main Document Title

This is an introductory paragraph explaining distributed system fundamentals and architectural patterns.

Section One: Core Features

The primary features of our architecture are outlined in the following list:

- High availability through multi-region replication.
- Fault tolerance with automated leader election.
- Low-latency data replication using consistent hashing.

Section Two: Operational Procedures

Follow these numbered steps in sequence to perform an orderly rolling upgrade:

1. Stop incoming traffic by updating the reverse proxy routing rules.
2. Drain active worker connections and wait for pending tasks to finish.
3. Upgrade the binary executable to the target release version.
4. Restart the node service and verify the health check endpoint.

Subsection: Monitoring and Telemetry

Ensure all Prometheus metrics report steady state before proceeding to the next cluster node.
